

# FashionSearchAI — Project Report

## Objectives

The main objective of this project is to develop a fashion query response system that utilizes AI models to provide detailed and user-friendly responses to fashion-related queries. The system aims to enhance user experience by generating informative and contextually relevant answers, thereby assisting users in finding fashion items based on their preferences.

## Design

The project involves two main layers: the search layer and the generation layer. The search layer is responsible for retrieving relevant fashion items from the dataset based on semantic similarity and light domain filtering. The generation layer utilizes advanced AI models (e.g., GPT-3.5) to produce detailed, context-aware natural language responses.

- Search Layer: Vector search over embedded product text with caching and optional re-ranking.
- Generation Layer: LLM-driven answer composition grounded on the top search results.

## Implementation

The implementation involved several steps, including data preprocessing, model integration, and query response generation.

### ***Data Preprocessing***

- CSV dataset formatted to enhance data quality and readability.
- Blank entries replaced and decimal points standardized.
- Unnecessary columns removed.
- Text columns cleaned to remove HTML tags and extra characters.

### ***Model Integration***

- Advanced AI models like GPT-3.5 integrated for response generation.
- Queries passed through the model to generate detailed and contextually relevant responses.
